

Async/await and Error handling

```
// async / await
// it is a cleaner way to work with promise
// it makes asynchronous code look like similar to normal
synchronous code
// async => its always return a promise
// async function greet(){
//     return "Hello satyam"
// }
// greet().then((data) => console.log(data))

// await => used to wait for a promise to settle
// async function getData(){
//     const data = await Promise.resolve("Data received")
//     console.log(data)
// }
// getData()
//promise
// const promise = fetch(".....")
// promise
// .then((response) => {
//     return response.json()
// })
// .then((data) => {
//     console.log(data)
// })
// .catch((error) =>{
```

```

//      console.log(error)
// })
// async function getUsers(){
//      const response = await fetch(".....")
//      const data = await response.json()
//      console.log(data)
// }

// Error handling
// try and catch
async function getUsers() {
    try {
        const response = await
fetch("https://jsonplaceholder.typicode.com/users")
        const data = await response.json()
        console.log(data)
    } catch (error) {
        console.log(error)
    } finally {
        console.log("GetUsers chal gaya")
    }
}
getUsers()
// custome error => throw new Error
// function checkAge(age){
//      if(age < 18){
//          throw new Error("Age is less:")
//      }
//      return "allowed"
// }
// console.log(checkAge(17))

```
